

Goran Stosic Belgrade +381691602225 business@goran-stosic.rs		
Profiles	goran-stosic goranstosic	
Experience	SGW Studio Full Stack Engineer (Full-Time) Music Reactions Designed and built a full-stack event ticketing platform as a monorepo housing four applications. The backend is a Laravel API running on Octane + OpenSwoole with a polyglot data layer — MySQL for relational data, MongoDB for request logging, Redis for cache and queues. Key features include multi-phase ticket pricing with automated transitions, a unified order and payment flow, PDF invoice and ticket generation with QR/barcode support, and Croatian FINA fiscal compliance via a custom SOAP integration. Background processing runs on Laravel Horizon; real-time chat on Laravel Reverb (WebSockets), with AWS SES handling transactional email. Migrated the public-facing frontend from Flutter Web to Next.js (React, TypeScript, SASS) using the App Router, progressively replacing the Flutter site while retaining the Flutter app as an internal admin dashboard. Integrated Google Ads and Facebook Pixel for conversion tracking. Deployed to AWS S3 + CloudFront via GitLab CI/CD. Developed a cross-platform Flutter mobile app (iOS/Android) with Riverpod state management, JWT authentication, and real-time chat via Pusher Channels bridged to Laravel Reverb. Shipped to TestFlight and Google Play. Infrastructure: GitLab CI/CD across all apps, AWS EKS (Kubernetes, Helm) for the API, S3 + CloudFront for the web frontends, S3 for media storage. Tourism For Europe Built a production marketing microsite for the European Travel Commission (ETC) at tourismforeurope.eu, showcasing sustainable tourism stories from across Europe. Designed a headless WordPress setup pairing Next.js (App Router) with the WordPress REST API and ACF. Used Incremental Static Regeneration with on-demand cache purging, static generation for all custom post type entries, and a server-side API proxy to keep the WordPress origin hidden from the browser. Deployed via Next.js standalone output to a self-hosted Node environment. Engineered an animation-heavy frontend with GSAP ScrollTrigger, an interactive SVG map covering 35+ European countries, and a multi-dimensional filtering system for the CPT archive (server-fetched data, client-side ACF filtering, shareable URL state). Built custom components including a draggable image gallery with accessible lightbox and a deferred-load video player, all underpinned by a CSS design token system with per-category theming. Misshosting Developed a custom Elementor addon for a hosting and domain provider, enabling dynamic product and pricing display via a RESTful external API. Built 11 custom widgets covering products, bundles, and domain (TLD) pricing, with support for multiple billing cycles and currencies. Implemented layered caching (transients + object cache), configurable authentication (bearer token, API key, basic auth), and public AJAX endpoints for real-time pricing updates. Refined checkout routing logic and product configuration displays on the storefront side. Structured as a namespaced OOP plugin following WordPress coding standards. AceBears WordPress developer (Full-Time) March 2022 - July 2024 Belgrade https://acebears.com/ Built the National Library of Serbia's digital manuscripts platform end-to-end — admin dashboard, public-facing web app, and API — enabling library staff to curate and publish thousands of manuscripts online. Stack: React/Next.js and Node.js/NestJS. Built a React/Next.js admin dashboard for Veerny, a mobile app connecting kindergarten staff with parents through activity updates and direct communication. Built a React-based admin UI for Princip, a clothing and accessories retailer, to orchestrate order processing and multi-warehouse stock management on top of WooCommerce's REST API. Extended a custom WordPress theme with ACF and custom Gutenberg blocks to deliver an interactive, animated city map (vanilla JS + CSS) for the Max Planck Institute's MPG Cities project. WeAreOSM WordPress Developer (Full-Time) October 2020 - March 2022 Belgrade https://weareosm.com/ Developed a headless WordPress theme with React and GraphQL for a leading international clothing brand, enabling the launch of their Serbian storefront. Built custom themes from scratch for major Belgrade businesses, collaborating with in-house developers and designers. Also handled technical maintenance, migrations, and troubleshooting across a range of WordPress sites. CircleBC WordPress Developer (Full-Time) October 2013 - July 2019 Sydney https://www.circlebc.com.au/ Built and maintained WordPress websites end-to-end for high-profile Australian clients in the telco and finance sectors, focusing on front-end work and custom themes developed from scratch. Also contributed to several Drupal builds as part of the outsourced CircleBC team.
